

ABSTRACT OF THE DISCLOSURE

A device for the combined presentation of first and second items includes first and second elements, each detachably securable to the first item and the second item. The first and second elements are adapted to resiliently engage the first and second items. A connecting member interconnecting the first element and the second element is resiliently foldable between a relaxed configuration in which the first and second elements are coplanar, and a folded configuration in which the first and second elements are coaxially aligned.
